WORK EXPERIENCE

DFINITY Stiftung **Oct. 2022 – Present**

Site Reliability Engineer *Zurich, Switzerland*

- Developed a distributed service discovery system for enumerating machines across different environments that Dfinity operates, enabling querying, monitoring and automation layers on top powering company-wide automation.
    - **Stack:** Rust; Python; Kubernetes (FluxCD for GitOps).
- Designed and built a centralized, horizontally scalable, multi-environment log aggregation platform processing ~320GB/day of logs (from mainnet) on 4 machines, enabling near-real-time debugging and reducing incident resolution from days to hours.
    - **Stack:** Rust; Python; Kubernetes; Vector.dev (log processing); Elasticsearch, Kibana.
- Built an automated release controller replacing a manual, multi-step release process (testing, qualification, release notes, publishing), enabling reliable weekly releases and significantly reducing operational toil.
    - **Stack:** Python; Kubernetes; Bazel (building and testing); Discourse (for forum posts).
- Migrated observability stack from cloud infrastructure to on-prem Kubernetes clusters, significantly reducing operational costs while improving reliability.
    - **Stack:** Python; Kubernetes; VictoriaMetrics; Elasticsearch; Kibana.
- Developed tooling for on-call enrollment and incident coordination, reducing scheduling overhead and improving postmortem workflows. Heavily focused on user experience allowing really easy scheduling and hand-overs.
    - **Stack:** Python; Google Sheets; OpsGenie; Jira Service Management; PagerDuty.

Software Engineer *Zurich, Switzerland*

- Contributed to core distributed system components responsible for network state management and incentive mechanisms in a decentralized system.
- Improved pre-production reliability with various enhancements to distributed system testing drivers.
    - **Stack:** Golang; Rust; Bazel; Docker.
- Built various tooling to help developers and community members easy interaction with the network.

Sotex Solutions **May. 2021 – Oct. 2022**

Fullstack software engineer *Novi Sad, Serbia*

- Developed microservices processing high-throughput event streams with near-real-time aggregation for smart metering data.
- Heavily emphasized on Terraform and Infrastructure as Code (later migrated to Pulumi).

EDUCATION

Faculty of Technical Sciences **December 2023**

Master of Software engineering and Automation *Novi Sad, Serbia*

- **GPA: 9.75/10.0**
- Worked as a teaching assistant on a number of subjects, including cyber security, microservice oriented architectures and devops.

SKILLS & INTERESTS

- **Technologies:**
    - Programming languages: Rust, Golang, Python, dotnet (C#) and others
    - Cloud providers: worked with all of them to some degree, mostly AWS, Azure and GCP.
    - Orchestration: Docker / Podman, Kubernetes, Terraform, Pulumi
- **Skills:** Highly motivated; Persuasive; Communicative; Good public speaker.
- **Interests:** Weightlifting; Football; Traveling; Youtube; The Blacklist; Distributed Systems; Integrations.
